

The name of Allah the Merciful

Silent Terror series

Lethal gases

Explanation No. (1)

Phosphine gas PH_3

Submitted by your brothers

Al - Saqri Institute for War Sciences

an introduction :

Praise be to Allah, who said" and prepare for them what you can of strength and well-readied horses to terrify enemy of Allah and your enemy"

Peace and blessings be upon the leader of the Mujahideen

And upon his family and companions, then:

Your brothers at Al- Saqri Institute for War Sciences present to you a new series of Silent Terror called the "Lethal gas series"

To you, O' muslim to disturb the living of the cross and its supporters everywhere.

We present this work and ask Allah to accept from us and you and we are not responsible in front of Allah about the use of what we present against any Muslim on the of earth

This work is presented to the brothers, the caliphate supporters to defend

Islam and the state of Islam, which in attack by infidels and their supporters of the apostates.

We ask Allah to grant you reconciliation and repayment, and we remind you to begin work by taking protective measures in order to protect yourselves from harm, and Allah is best protector, and Allah is the most merciful. Praise be to Allah, Lord of the Worlds

Phosphine Gas PH_3

The effect of phosphine gas is almost the same as that of phosphorus

Symptoms start immediately or after several hours of exposure accompanied by nausea and vomiting with luminous radiation and then the destruction of physical cells, especially kidney cells, heart and muscle and the nervous system, a garlic taste will be distinct in the mouth with

sore throat and swelling of the tongue and colic in the abdomen, accompanied by a green or black vomiting and in case of severe exposure

The vomiting will be pure blood with diarrhea and if the infected person remains alive after the third day of infection, he will get (Jaundice).

Properties of phosphine gas:

The gas is very poisonous and has the smell of garlic that is unacceptable and it dissolves in water to some extent, and ignites in the air at 150° producing phosphoric acid which is its inhalation for 1.5 minutes is sufficient for the occurrence of symptoms and death and has no treatment.

Explanation and definition:

The silent killer, the Lethal poison or the lethal gas

all are names of one of the most dangerous things the human could be exposed to;

(Aluminum Phosphide), or the gas resulted from it i.e

(Phosphine), poisonous and fatal. A large number of deaths have been observed as a result of human poisoning and animals after exposure to it, Many cases of poisoning and deaths was recorded last years; due to the use of "Aluminum phosphide" as an insecticide; because of ignorance of its use or how to avoid its side effects and its prevention. It is ideal to eliminate insects, of all types and stages of growth, without affecting the vitality of plants or their seeds, which leads to its use in agriculture purposes.

It is important to note that there is no anti-toxin or antidote for this gas, which makes it more dangerous than other insecticides, authorized to be used, it is killing its victims

silently. Phosphine gas was banned in the early 1990s

And classified as toxic gas, according to the Department of Health in crusader america which is responsible for health and safety in the workplace.

Why do you call it the Silent Killer?

Doctors collect, however, when looking at the body of victims of (Phosphine), it is difficult to predict the cause; So it is like a silent killer; it does not leave any marks or evidences of its presence, only blue lips

and a cold body, which leave the doctors in a state of confusion, and then many conclusions coming out and the search for evidences for such cases.

Definition and nature:

The scientific encyclopedias defines (ALUMINUM PHOSPHIDE) as:

It is a chemical compound called PH_3 , a flammable gas, colorless, considered to be one of the toxic gases. The pure phosphine is odorless, but the technical samples have a very bad smell, such as garlic or rotten fish, and this is due to

Presence of phosphine with diphosphane (P_2H_4).

"Phosphine" is used extensively as insecticides for insects and rodents, It was known since 1940, when it spread rapidly,

As an effective insecticide sprayed for agricultural purposes, due to fast production of the gas.

When the Phosphine tablets are exposed to the air, react with moisture and release toxic gas (phosphine), When people are exposed to it, symptoms appear

Which are similar to the symptoms of food poisoning ..

They are: - Shortness of breath. - vomiting and nausea.

- coldness of the limbs and generalized weakness of the body.

- Inability to concentrate. Headache. - diarrhea.

In many cases, it is difficult to help the victims, unless there is clear and accurate dealing with the situation.

Insecticides like (ALUMINUM PHOSPHIDE):

Experts identify several insecticides similar to

(ALUMINUM PHOSPHIDE), according to release of

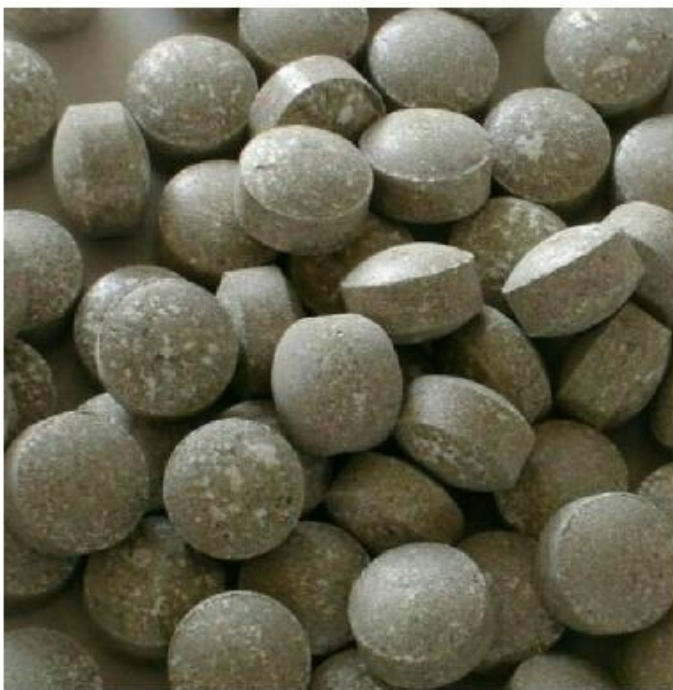

Phosphate (PH_3) with different concentrations,

Among these insecticides:

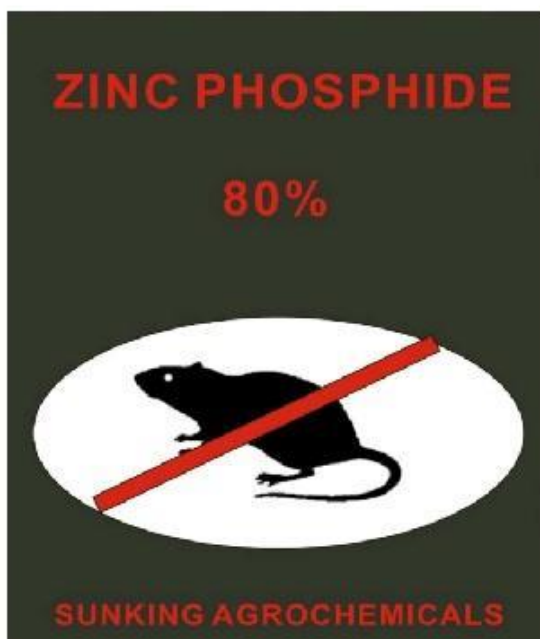

(ZINC PHOSPHIDE) AND (MAGNESIUM PHOSPHIDE)

Aluminum phosphide

Gas tablets
Aluminum phosphide

Zinc phosphide

Zinc phosphide →

Magnesium phosphide

Just look at the ingredients and read them well

If you find in one of its components, "aluminum or

Zinc or Magnesium " phosphide, buy it, and do your mission O' mujahid

- you have only to get the gas pills which are used in the

Cereal stores which are widely available and contains 60% of Aluminum phosphide.

- Get some of those pills from any pharmacy, and crush them may be smitten to become soft powder of aluminum phosphide, know that

If you add some car batteries water "sulphuric acid" to this powder, lethal phosphine gas will be produced which is heavier than the air so it will remain for long periods in closed places, and it is highly toxic and fatal

In this series, we will talk about how to use all these materials in safe and secure ways, with good results in sha' Allah.

Phosphine gas as we mentioned earlier smells like Garlic, gas is used by filling the room with this gas and if the victim enters the room, half a minute of inhalation of this gas is sufficient to die, in sha' Allah.

This gas is prepared by: dropping parts of aluminum phosphide in sulfuric acid "car battery water"

- Calcium, Magnesium or Zinc phosphide in hydrochloric acid.

Method of Packing and Usage:

First :

You can combine them together fast inside the room or closed place with safety procedures followed, Of course, this can only be prepared in the same workplace.

Second:

Put the phosphide in a glass container that is easy to break, for example

Fifty grams of it in a glass can be easily break and put The hydrochloric acid or sulfuric acid according to the type of phosphide used, We always prefer aluminum phosphide. In a glass container that is easy to break, we also put 80 ml of the acid, then put both in the mortar missile, with stones as the Nazis did. When the missile falls, the containers will be broken and mixed. They can be applied to a hand grenade.

- We remind you our brothers and sisters that

- First :

Sulfuric acid (H_2SO_4) is car batteries water "and no suspicion in buying it ..

- Second:

Hydrochloric acid (HCL)," fire water" used in homes Called flash and comes in white For Flash

And the origin has no color, no smell or yellowish in color as shown in the following picture.

Note: We choose the easiest way to do your mission and there are other ways such as electric circuits, but we chose you the easiest and may Allah help.

And so we have finished the first gas of the series of silent terrorism "lethal gases"

And wait for us, in sha' Allah, to complete the series and we ask Allah to help us to avenge the kaafirs and do not forget us from your sincere prayers

- Preparation and submission by your brothers in the Al-Saqry Institute of War Sciences
